ABSTRACT

The new bread wheat cultivar Sids 13 has been developed by Wheat Research Department, Field Crops Research Institute, Agriculture Research Center, Egypt and selected from one of the advanced lines among ICARDA collections grown in wheat breeding program at Sids Agricultural Research Station. The grain yield of the new cultivar Sids 13 was evaluated through 66 experiments at two different levels of yield trials (11 preliminary and 55 advanced yield trials) in the three successive seasons 2004/2005, 2005/2006 and 2006/2007, respectively. The obtained results proved the superiority of the new cultivar Sids 13 as compared to the local commercial cultivars, Giza 168, Sakha 93 and Gemmiza 9 in the main five regions of Egypt, i.e. North Delta, South Delta, Middle Egypt, Upper Egypt and Out Valley. Moreover, stability parameters for grain yield cleared that the newly bread wheat cultivar Sids 13 has better stability parameters in both South Delta and Upper Egypt regions and could be recommended for planting in those regions. Also, the results of rust diseases reactions proved that Sids 13 has high resistance to all tested pathotypes of the three rust diseases under local conditions.

INTRODUCTION

Wheat (*Triticum aestivum* L.em. Thell) is the main human food crop in Egypt as well as in many parts of the world. However, there is a great gap between our local consumption (estimated by 12-14 M.tons) and production (estimated by 7-8M. tons, annually). The increasing demand on wheat due to the population increase with the limitation of area cultivated to wheat brings about a serious challenge to wheat breeder. Therefore, the only possible solution for this problem is to develop and grow new wheat cultivars having high yielding ability, resistant to diseases especially rusts and tolerant to

abiotic stresses such as salinity, drought and heat. Actually, this is the main goal of the Egyptian National Wheat Research Program (ENWRP), Field Crops Research Institute, Agricultural Research Center. In addition, increasing wheat production could be possible by growing wheat in the newly reclaimed areas (horizontal expansion). To achieve this goal, developing new cultivars tolerant to the adverse conditions are highly needed. Following this strategy, many cultivars have been developed by (ENWRP) such as Sids 1, Sakha 93, Giza 168, Gemmiza 7, Gemmiza 9, Sakha 94, Gemmiza 10 and Sids 12 during the last two decades . These cultivars are characterized by high yielding ability, resistant to diseases especially rusts, adapted to Egyptian conditions and characterized also by good grain quality.

This research work was undertaken to obtain additional wheat cultivar resistant to rusts with high yielding potentiality under different environmental conditions.

MATERIALS AND METHODS

The new promising cultivar, Sids 13 has been selected from one of ICARDA collections at Sids Agricultural Research Station, Egypt. However, the cross name and pedigree of the new cultivar is:
Sids 13 = ALMAZ- 19= KAUZ "S" // TSI/SNB "S". ICW94-0375-4AP-2AP-030AP-0APS-3AP-0APS-050AP-0AP-0SD.

Moreover, three yield trials were carried out to test the new cultivar Sids 13:

1- Preliminary Yield Trials (2004/2005):

The newly released cultivar Sids 13 was tested for grain yield ability against those of local check cultivars Giza 168, Sakha 93, Sakha 94, Gemmiza 9, Gemmiza 10 and Sids 1 in eleven preliminary yield trials conducted at eleven research stations representing different ecological zones of wheat growing regions; Sakha (North Delta), El-Gemmiza, Itay El-Barod and Kafr El-Hamam (Middle Delta), Sids and Mallawy (Middle Egypt), Shandaweeil, El-Matanaa and Kom Ombo (Upper Egypt), as well as the New Valley and El-Nubaria (Out Valley) in 2004/2005 season. The experimental design used in these trials was the randomized complete block design (RCBD) with four replicates according to Steel and Torrie (1980). The plot area was 6 rows, 3.0m long and 20cm apart (3.6 m²).

2- Advanced Yield Trials (2005/2006 and 2006/2007):

Sids 13 and some other promising lines were tested for yielding ability versus local check cultivars, Giza 168, Sakha 93 and Gemmiza 9 in 27 and 28 advanced yield trials in 2005/2006 and 2006/2007 seasons, respectively. In these advanced yield trials, all promising lines as well as checks were tested in large plot area experiment (3.0m x 3.5m = 10.5m² each). Genotypes under investigation were evaluated in a randomized complete block design experiment with four replications.

In addition, stability parameters for grain yield were calculated according to Eberhart and Russell (1966).

RESULTS AND DISCUSSION

1- Preliminary Yield Trials:

Table (1) presents grain yield (ard/fad) of the preliminary yield trials for Sids 13 and six bread wheat cultivars (checks) in 2004 / 2005 season. In North Delta, Sids 13 exceeded the check mean with 4.33%, while in Middle Delta the increase of Sids 13 over the mean check ranged from 4.87% to 17.81%. These results confirm that Sids 13 has high yielding ability over commercial cultivars in mentioned regions and agreed with that obtained by Hanna *et al.* (1997). Moreover, in Middle Egypt, Sids 13 out yielded the check mean by 14.19% at Mallawy and 16.40% at Sids. These results showed the high adaptability of Sids 13 for Middle Egypt and similar with that obtained by Mitkees *et al.* (1998). In addition, in Upper Egypt, the increase in grain yield for Sids 13 over checks mean ranged from 11.18% at Shandaweeil to 13.19% at Kom Ombo. Only, at El-Matanaa the check mean out yielded Sids 13 by 6.75%.

The highest increase in grain yield for Sids 13 over checks mean was obtained in Out Valley at the New Valley experiment (22.82%) while at Nubaria (14.27%). These results cleared that the newly bread wheat cultivar Sids 13 has high yielding ability and good adaptability to be cultivate in old and new lands of Egypt.

2- Advanced Yield Trials:

The results in table (2) appear grain yield (ard/fad.) of the advanced yield trials for Sids 13 and three bread wheat cultivars (checks), i.e. Giza 168, Sakha 93 and Gemmiza 9 at 27 sites all over Egypt in 2005/2006 season. In North Delta, there were insignificant differences between the newly bread wheat cultivar Sids 13 and the check mean. While, in South Delta, Sids 13 significantly out yielded the checks mean at Gemmiza and Kafr El-Hamam. These results are in agreement with those obtained by Shehab El-Din *et al.* 1999, 2000 and 2005. Moreover, in Middle Egypt, the new bread wheat cultivar Sids 13 had significantly exceeded the check cultivars mean only at Sids, while, at Giza the check cultivars mean had significantly surpassed Sids 13. In Upper Egypt region, there was insignificant difference between Sids 13 and the check mean. However, in Out Valley, Sids 13 had the highest significant grain yield at two of the seven tested locations (Ismailia and Monofiaa). These results cleared the superiority and high yielding ability of the newly bread wheat cultivar in the main five regions, i.e. North Delta, South Delta, Middle Egypt , Upper Egypt and Out Valley and confirmed with that obtained by El-Shamy *et al.* (2005).

Table (3) showed grain yield (ard/fad.) of the advanced yield trials for Sids 13 and the same three bread wheat cultivars (checks) in 2006/2007 season. Sids 13 had significantly out yielded the check cultivars mean at two of the tested locations in North Delta and at one of the tested locations in both Upper Egypt and Out Valley. These results revealed that the newly bread wheat cultivar Sids 13 has high potentiality and yielding ability and agreed with that obtained by Shehab El-Din *et al.* 1999, 2000 and 2005. However, in both South Delta and Middle Egypt regions the check cultivars mean had significantly surpassed Sids 13.

3- Stability Parameters for Grain Yield:

Stability parameters for grain yield of the advanced yield trials in 2005/2006 season were calculated according to Eberhart and Russell (1966). The stable cultivar according to this method was defined as one which had a high average performance over a wide range of environments, a regression coefficient of 1.0 and no deviation from regression mean square. The results in tables (4 and 5) cleared that the newly bread wheat cultivar Sids 13 has better stability parameters in both South Delta and Upper Egypt regions and could be recommended for planting in those regions. These results are similar to that obtained by Mitkees et al. (1998).

4- Rust Diseases Reaction:

Data shown in table (6) revealed the reactions of the new bread wheat cultivar Sids 13 against the three wheat rusts, yellow (YR), leaf (LR) and stem (SR) in advanced yield trials at Sakha and El-Nubaria agricultural research stations in 2006/2007 season. These data proved that Sids 13 posses high resistance to all tested pathotypes of the three rust diseases. Moreover, the

calculated Average Coefficient of Infection (ACI) for the three rust diseases for Sids 13 and the three commercial cultivars at the adult stage at Sakha and El-Nubaria Agricultural Research Stations in 2006/2007 season is presented in table 7. These data confirm the high resistance of the newly bread wheat cultivar Sids 13 to the three wheat rust disease

* قسم بحوث القمح-معهد بحوث المحاصيل الحقلية -مركز البحوث الزراعية - مصر.

** قسم بحوث القمح-معهد بحوث امراض النبات- مركز البحوث الزراعية - مصر.

تم استبيان صنف قمح الخيز الجديد سدس ١٣ في محطة البحوث الزراعية بسدس بالانتخاب من أحدث المجموعات المستوردة من المركز الدولي للبحوث الزراعية في المناطق الجافة (إيكاردا) . وقد أجريت ٦٦ تجربة تحليلية لمقارنة محصول الصنف الجديد (١١ تجربة مصغرة و ٥٥ تجربة مكبرة) في الفترة من ٢٠٠٤-٢٠٠٧ وقد أوضحت النتائج تفوق صنف القمح الجديد سدس ١٣ على أصناف القمح التجارية جيزة ١٦٨ وسخا ٩٣ وجيزة ٩ في المناطق الرئيسية بمصر في شمال وجنوب الدلتا ومصر الوسطى والعليا وخارج الوادى .

وأوضح تحليل الثبات لمحصول حبوب الصنف الجديد سدس ١٣ أنه يتميز بالثبات في منطقى جنوب الدلتا ومصر العليا وملائمة للزراعة في هاتين المنسطقتين . كما أوضحت النتائج مقاومة صنف القمح الجديد سدس ١٣ لأمراض أصداء القمح الثلاثة .
