
ABSTRACT

The present investigation aimed to study the genetic performance of some economic traits, which will help to obtain high yielding varieties of hull-less barley to reduce the gap between the production and consumption of cereals in Egypt. Six genotypes were used in this study namely: 1-CI9984 (Hull-less) 2- Giza129 (Hull-less)

3-NUDINKA/WEIHENSTWPHAN173//RAN3/PERUGIASEL 1UH-OUH (Hull-less)

4-GIZA130. (Hull-less) 5- ITALIAN LANDRACE. (Hull-less) 6- GIZA121 (Hulled)

Half diallell cross was done among them. The experiments were set up during 2000/2001, 2001/2002 and 2002/2003 season at Giza Agric. Res. Stn.of Agric. Res. Center. In winter 2002/2003 seasons, parents, F₁ and F₂ populations were grown in randomized complete blocks design with three replications. Both (*Griffing, 1956*) and (*Hyman, 1954*) methods were used to estimate the genetic parameters such as heterosis, GCA., SCA., heritability, inbreeding depression and genetic components for morphophysiological traits (days to heading, plant height, number of tillers and spike length) and yield as well as components (number of spikes/plant, number of kernels/spike, spike kernels weight, 100-grain weight, grain yield/plant, biological yield/plant and harvest index) in F₁ and F₂ generations and also regression graphic presentation was also used.

The results could be summarized as follow: heterosis percentages of mid parent and better parent in F₁ generation were significant for the most crosses in the studied traits, while remain heterosis in F₂ generation were less then F₁ heterosis percentages.

Narrow sense heritability (hn) was low for all marphophysiological characters in F₁. Except day to heading, and no. of kernels per spike in F₁

studied characters.

Regarding G.C.A., S.C.A. Mean squares analyses revealed highly significant GCA. , SCA. For all studied characters in both F_1 and F_2 generations. According to component of genetic parameters, its results indicated the importance of additive and non additive gene effect controlling the inheritance of the most studied traits. The regression graphic presentation show in F_1 that P_1 possessed excess of dominant alleles for plant height, no. of tillers, spike length, no. of spikes/plant, 100-kernels weight, grain yield and biological yield. While P_5 possessed excess of dominant alleles for no. of tillers/plant, no. of spikes/plant, no. of kernels/spike, spike kernels weight, grain yield /plant and biological yield.

From the above mentioned results, it could be concluded that the parents P_1 , P_4 , P_6 and crosses ($P_1 \times P_6$), ($P_2 \times P_6$), ($P_3 \times P_6$), ($P_5 \times P_6$), ($P_1 \times P_4$), ($P_2 \times P_4$) and ($P_3 \times P_4$) showed the best results for most of the studied characters. These parents and crosses will be useful in breeding and improvement program of hull-less barley.
