19.	Acrosomal damages percentages, of sexual mature Quail Japanese males fed dietssupplemented with feed additive under hot environmental stress during the summer season (Means±S.E.).....	109
20.	percentages of advanced sperm motility and storagability, during incubation condition of diluted semen of sexual mature Quail Japanese males fed dietssupplemented with feed additive under hot environmental stress during during the summer season (Means±S.E.).....	111
21.	Dead spermatozoa percentages, during incubation condition of sexual mature Quail Japanese males fed dietssupplemented with feed additive under hot environmental stress during the summer season (Means ± SE).....	114
22.	Sperm abnormalities percentages, during incubation condition of sexual mature Quail Japanese males fed dietssupplemented with feed additive under hot environmental stress during the summer season (Means ± SE).....	116
23.	Acrosomal damages percentages, during incubation condition of sexual mature Quail Japanese males fed dietssupplemented with feed additive under hot environmental stress during the summer season (Means ± SE).....	118
24.	Level of Testis activation and Ovary activation.....	131

LIST OF PLATES

- Plate1:** Testis (control) showed mature seminiferous tubules (H&E-X100)
- Plate2:** Testis (ginseng or methionine) showed activation of spermatogenesis (H&E-X40).
- Plate3:** Testis (V.E) showed more activation of spermatogenesis (H&EXI00).
- Plate4:** Testis (folic acid) showed more activation of spermatogenesis (H&E- X40).
- Plate5:** Testis (Zn) showed pronounced activation of spermatogenesis (H&E- X40).
- Plate6:** Ovary (control or ginseng) showed immature follicles (H&E-X 100).
- Plate7:** Ovary (control or ginseng) showed immature follicles (H&E-X40).
- Plate8:** Ovary (vitamin E and folic acid) showed increase number of immature follicles (H&E X40).
- Plate9:** Ovary (vitamin E and folic acid) showed increase number of immature follicles (H&EX40).
- Plate10:** Ovary (vitamin E and folic acid) showed increase number of immature follicles (H&EX40).
- Plate11:** Ovary (zinc) showed pronounced number of immature follicles (H&E-XI000).
- Plate12:** Liver (control or ginseng) showed vacuolar degeneration (H&E- X40).
- Plate13:** Liver (methionine, vitamin E, folic acid and zinc) showed vacuolar degeneration and congested bloodvessels (H&E-X40).
- Plate14:** Kidney (control or ginseng) showed degeneration of renal tubules (H&E -X40).
- Plate15:** Kidney (methionine, vitamin E, folic acid and zinc) showed degeneration of renaltubules with inflammatory cell in filtration (H&E-X40).
- Plate16:** Heart showed no pathognomonic lesion in all groups (H&E- X 10).

LIST OF ABBREVIATIONS

ALT(GPT)	Alanine aminotransferase
AST(GOT)	Aspartate aminotransferase
A/G	Albumin /Globulin ratio
FC	Feed conversion
FI	Feed intake
Glb	Globulin
GLM	General Linear Models
g/dl	Gram/ deciliter
Hb	Hemoglobin concentration
Ht	Hematocrit value
Kcal	Kilo calorie
mg/dl	Milligram/deciliter
TP	Total protein
Vit	Vitamin
WBCs	White blood cells
µl/dl	Microliter/ deciliter
ng/ml	Nanogram/ Milliliter
dl	Deciliter (dl = 10⁻² liter)
mg	Milligram (mg = 10⁻³ gram)
ng	Nanogram (ng = 10⁻⁹ gram)
T₃	Triiodothyronine hormone
T₄	thyroxine
µL	Microliter
Kg	Kilogram
Wks	Weeks
RBCs	Red blood cells
WBCs	White blood cells
H/L	Heterophil/Lymphocyte
Zn	Zinc

ACKNOWLEDGEMENTS

To who belong Might and Majesty, the Great Almighty, possessor of Stature and Solemnity, **ALLAH**, without Divine Supreme Being, nothing will be. I would first like to give thanks to **God** for giving me the knowledge to achieve, the faith to believe, and the courage to succeed in all of my endeavors. Without his help and countless hours of prayer, I know that this day would not have been possible.

I would like to initiate display Profuse thank to the members of my supervising committee, **Prof. Dr. Wafai Z.A.Mikhail**, Professor of Animal Resources, Department of Natural Resources –Inst.of African Research & Studies- Cairo University, on the continuous support beginning the Ph.D. studying to completion this thesis.Secondly, morale supporting with advice, guidance and rectification.

As such, I am desires to express my great gratitude to **Prof. Dr. A.A.H. Tolba**, Professor of Poultry Husbandry, Animal Production Research Institute, Agricultural Research Center, Ministry of Agriculture for his revising the manuscript, beneficial counsel, powerful sustainment, and permanent encouragement, which unless it this study not be able to bring to light.

Special thanks to **Prof.Dr. Faten A. A. Ibrahim**, Professor of Poultry Husbandry, Animal Production Department, Faculty of Agriculture, Cairo University, Who illumine the way for me and numerous researchers and were honest in recommendations and at consultation.

I am plentiful beholden to **Prof. Dr. M. O. Abd-Elsamee**, Professor of Poultry Nutrition, Animal Production Department,

Faculty of Agriculture, Cairo University on his efforts that exerted in practical side following, thesis revision, who not stingy with support or spare any time and do the best to complete this thesis in the final shape.

My appreciation goes especially to **Prof.Dr.T.S.T. Seleem**, for his kind help in the project of Ph.D., continuous encouragement, and valuable advice.

I would also like to express thanks to **Eng. Ahmed Shahat**, **Eng. Gomaa Ramadan** and all staff members of staff workers of poultry breeding department for their kind help in the project of my Ph.D.

My project would not have been possible without the help and support of My Family (my Parents special my Father, God blesses his soul and my Brothers) and Colleagues and Friends.

Gratitude necessary to Animal Production Research Institute on this financing throughout 3 years sharing with Faculty of Agriculture– Cairo university.

ABSTRACT

This study was conducted at Agriculture Experiments Station, belonging to Agriculture Faculty, Cairo University, Egypt. The chemical analysis was carried out at the laboratories of Animal Production Research Institute and Animal Health Research Institute. The aim of this work was to investigate the effect of addition of (Ginseng, Methionine, Vitamin E, Folic acid and Zinc) to conventional diet on the fertility and immunity of Japanese quail under hot environment stress during summer season (may -june-july) of Egypt. Birds were fed the basal diet with different additives from 6 to 20 week of age as follow: {control, 300 mg Ginseng, 0.3% Methionine, 200 mg Vitamin E, 2 mg Folic acid, 60 mg Zinc / kg basal diet}. A total number of two hundred and sixteen birds of Japanese quail at 6 weeks of age, which distributed randomly into sex treatment groups. Thirty six birds were assigned to each group which divided into three replicates, each containing twelve birds (4 males and 8 females).

The main results obtained from this study can be summarized as follows: all dietary supplementation exhibited that live body weight, feed consumption, feed conversion ratio, egg production (egg weight, egg mass, Fertility and Hatchability) ($P \leq 0.05$) improved significantly compared to their counterparts in control group. But there was not significantly improved in egg quality compared to their counterparts in control group. Also the statistical analysis revealed that, the supplementation of Ginseng, Methionine, Vitamin E, Folic acid and Zinc exhibited no significant effect in each of blood biochemical measurements like Total Protein, Globulin, Total Lipid, Cholesterol, GPT, GOT, Urea, Creatinin, Calcium and Phosphorus or hormones like Progesterone and Testosterone at 20 wks of age comparing to its counterpart in Control group. However, quail laying hens fed diet supplemented with Ginseng, Vitamin E, and Folic acid were exhibited significantly ($P \leq 0.05$) higher T3 (Tri-iodothyronine) hormone as compared with its value in facing un-supplemented Control hens. However, Methionine and Zinc supplementation exhibited insignificantly increased T3 (Tri-iodothyronine) hormone compared to their counterparts in Control group. Supplementation of Ginseng, Methionine, Vitamin E, Folic acid and Zinc exhibited no significant effect in each of Leucocytes cells (white blood cells) (WBCS) or Erythrocytes (Red Blood Cells) (RBCS) at 20 wks of age as comparing to its counterpart in control group. There were ($P \leq 0.05$) significantly decreased in Heterophil cells and H / L ratio. However, ($P \leq 0.05$) significantly increased in Lymphocyte cells due to feeding Japanese quail laying hens on diets supplemented with Vitamin E as compared with its value in facing Control hens. In the same time, there were ($P \leq 0.05$) significantly increased in Monocyte and Eosinophil cells due to feeding Japanese quail laying hens on diets supplemented with Ginseng, Methionine, Vitamin E, Folic Acid and Zinc, with absence of Eosinophil Cells with Zinc supplementation. Also, Basophil were ($P \leq 0.05$) significantly increased due to feeding Japanese quail laying hens on diets supplemented with Methionine, Vitamin E and Folic acid, with absents of Basophil Cells with Ginseng and Zinc supplementation as compared with its value in facing Control hens. There were no significantly affect in semen chemical analysis measured as calcium, phosphorus, total protein, albumin, cholesterol, urea and creatinine due to feeding Japanese quail laying hens on diets supplemented with ginseng, methionine, vitamin E, folic acid and zinc as compared with its value in facing control hens. In Physical characteristics of diluted fresh semen or of stored, and incubated diluted semen: The supplementation of ginseng, methionine, vitamin E, folic acid and zinc to quail males diets caused ($P \leq 0.05$) significantly enhancement of mass sperm motility (Score), advanced sperm motility (%) and sperm-cell concentration at 18 wks old as compared to un-supplemental control diet. Dead spermatozoa (%), sperm abnormalities (%) and acrosomal damages (%) were ($P \leq 0.05$) significantly improved as affected by feeding quail males diet inclusion of feed additive compared with control diet. Significant improvements were not only in fresh semen but also during chilled storage semen from 1 or 3 days or during incubate the semen from 2 or 4 hours. Testicles histopathological examination recommended that ginseng, methionine, vitamin E, folic acid and zinc supplementation to quail laying hens diet is the best than control group. Ovary histopathological examination recommended that zinc supplementation to laying hens diet is the best compared with other treatment. It could be concluded from this study that supplementation of Ginseng, Vitamin E, Methionine, Folic acid and Zinc to conventional diet of Japanese quail under hot environment stress during summer season improved fertility and immunity.

Key words: Ginseng, Vitamin E, Methionine, Folic acid, Zinc, Japanese quail, Layer, Performance, immunity.
