CONTENTS

NO:	Subject	Page
1.	INTRODUCTION	1
2.	REVIEW OF LITERATURE	3
2.1.	Organic amendments and their implications on soil physical and chemical characteristics	3
2.1.1	Soil bulk density and porosity as affected by the soil application of organic amendments	4
2.1.1.1	Effect of compost on soil bulk density and porosity	4
2.1.1.2	Effect of biochar on soil bulk density and porosity	5
2.1.2.	Water holding capacity as affected by the soil application of organic amendments	7
2.1.2.1.	Effect of compost on water holding capacity	8
2.1.2.2	Effect of biochar on water holding capacity and field capacity	8
2.1.3.	Cation exchange capacity (CEC) as affected by the soil application of organic amendments	10
2.1.3.1.	Effect of compost on cation exchange capacity (CEC)	11
2.1.3.2.	Effect of biochar on cation exchange capacity (C.E.C)	11
2.1.4.	Soil pH as affected by the soil application of organic amendments	12
2.1.5.	Soil organic carbon (SOC) as affected by the soil application of organic amendments	13
2.1.5.1.	Effect of biochar on soil organic matter and soil organic carbon (SOC)	13
2.1.5.2.	Effect of biochar on soil organic matter and soil organic carbon (SOC)	14
2.2.	Nutrient availability and status in plants as affected by the soil application of organic amendments	15
2.2.1.	Effect of compost on nutrients availability	15
2.2.2.	Effect of biochar on the availability of soil nutrients	17

NO:	Subject	Page
	2.2.3. Effect of compost on plant nutrients concentration	18
	2.2.4. Effect of biochar on plant nutrients content and uptake	20
	2.2.5. Effect of compost on yield	21
	2.2.6. Effect of biochar addition on crop yield	23
	2.3. The combination between compost and biochar and the experimental hypotheses	24
3.	Materials and Methods	27
	3.1 Materials of study	27
	3.2. The experimental design and the field study.	30
	3.2.1 The peanut experimental work (summer season)	31
	3.2.2 The wheat experimental work (winter season)	31
	3.3. Methods of analyses	32
	3.3.1 Soil analysis	32
	3.3.2 Plant analysis	33
	3.4 Data analysis	33
4.	Results and Discussion	35
	4.1. Results	35
	4.1.1. Effect of the organic amendments on the outcome yield	35
	4.1.1.1 Peanut yield	35
	4.1.1.2. Wheat yield	38
	4.1.2. Effect of organic amendments on soil physical characteristics	41
	4.1.2.1. Effect of organic amendments on soil water retention and available soil-moisture contents	41
	4.1.2.2. Effect of the organic amendments on soil bulk density and soil hydraulic conductivity	44
	4.1.3. Effect of the organic amendments on soil chemical characteristic	47
	4.1.3.1. Soil pH and EC	47
	4.1.3.2. Residual organic C (ROC) and soil CEC	50
	4.1.4. Effect of organic amendments on the availability of soil	53

List of Tables

No.	Table	Page
1	Physical and chemical characteristics of the studied soil	28
2	Physical and chemical properties of the applied compost and biochar amendments	29
3	Peanut growth parameters and yield components (means \pm SD) as affected by amending soil with compost and biochar solely or in combinations	36
4	Wheat growth parameters and yield components (means \pm SD) as affected by amending soil with compost and biochar solely or in combinations	39
5	Soil moisture contents (means \pm SD) as affected by amending soil with compost and biochar solely or in combinations	42
6	Soil hydraulic conductivity and soil bulk density (means \pm SD) as affected by amending soil with compost and biochar solely or in combinations	45
7	Soil pH and EC (means \pm SD) as affected by amending soil with compost and biochar solely or in combinations.	48
8	Soil CEC and the residual organic C (ROC) (means \pm SD) as affected by amending soil with compost and biochar solely or in combinations	51
9A	Extractable NPK in soil and their concentrations within the different plant parts (peanut yield) (means \pm SD) as affected by application of compost and biochar either solely or in combinations.	54

No.	Table	Page
9B	Extractable NPK in soil and their concentrations within the different plant parts (wheat yield) (means \pm SD) as affected by application of compost and biochar either solely or in combinations.	55
10 A	AB-DTPA extractable Fe, Mn and Zn in soil and their concentrations within the different plant parts (peanut yield) (means \pm SD) as affected by application of compost and biochar either solely or in combinations	60
10 B	AB-DTPA extractable Fe, Mn and Zn in soil and their concentrations within the different plant parts (wheat yield) (means \pm SD) as affected by application of compost and biochar either solely or in combinations	61

List of Figures

No.	Figure	Page
1	Peanut growth parameters and yield components (means \pm SD) as affected by amending soil with compost and biochar solely or in combinations. See footnote Table 3	37
2	Wheat growth parameters and yield components (means \pm SD) as affected by amending soil with compost and biochar solely or in combinations (see footnote Table 3). Different letters indicate significant differences between treatments ($P<0.05$).	40
3	Soil moisture contents (means \pm SD) as affected by amending soil with compost and biochar solely or in combinations (see footnote Table 3). Different letters indicate significant differences between treatments ($P<0.05$).	43
4	Soil hydraulic conductivity and soil bulk density (means \pm SD) as affected by amending soil with compost and biochar solely or in combinations (see footnote Table 3). Different letters indicate significant differences between treatments ($P<0.05$)	46
5	Soil pH and EC (means \pm SD) as affected by amending soil with compost and biochar solely or in combinations (see footnote Table 3). Different letters indicate significant differences between treatments ($P<0.05$).	49
6	Soil CEC and the residual organic carbon (means \pm SD) as affected by amending soil with compost and biochar solely or in combinations (see footnote Table 3).	52

in US dollar (1 US dollar= 17 L.E). (see footnote Table 3). Different letters indicate significant differences between treatments ($P<0.05$).

6- Summery

Poor fertility and low water retention at the different soil moisture constants are both limiting factors of crop productivity in sandy soils. Recycling organic wastes might provide such soils with nutritive elements and, at the same time, improves their chemical and physical characteristics. Thus, two organic amendments (biochar and compost) were selected in the current study to investigate their effectiveness as amendments of a sandy soil while considering the following two assumptions: (H1) efficiency of a half dose of biochar or less is comparable to the effect of the full dose of compost for improving soil physical and chemical characteristics. Furthermore, the residual effects of biochar (vs compost) on soil properties seemed to be more noticeable in the successive growing season. (H2) Biochar can negatively affect the bio-availability and concentrations of P and soil micro-nutrients within the areal parts of plants due to its alkaline nature on one hand, and its relatively high persistence in soil, on the other one. Accordingly, a sandy soil (of low buffering capacity) was amended with either biochar (BS at elevated rates) and/or compost (CT), solely or in combination and then planted with peanut. The residual effect of these amendments was investigated in the successive season on wheat. Results revealed that the effect of applying $12.5 \text{ Mg Bs ha}^{-1}$ was almost similar to that of

applying 25 Mg CT ha⁻¹ during the two seasons of study. On the other hand, the application of only 5 Mg Bs ha⁻¹ could improve slightly; but insignificantly some soil characteristics. The combination between “Bs+CT” recorded further significant improvements in the abovementioned characteristics especially at the higher doses of application. Thus, we partially accept the first assumption. To investigate the second one, the availability of N, P, K, Fe, Zn and Mn nutrients was considered in the investigated soil by the end of each growing season in addition to the concentrations of these nutrients within the areal parts of the grown plants. Results obtained herein indicate that biochar underwent considerable decomposition in sandy soils shifting the pH slightly towards alkalinity. . On the other hand, both the biochar and compost could improve significantly the availability of soil macro-and micro- nutrients and hence increased their uptake by the grown plants. These finding does not, therefore, support the second hypothesis. In conclusion, biochar is recommended as a slow release fertilizer for macro- and micro-nutrients when applied at only a half dose of compost and its effect on soil physical and chemical characteristics may extend for more than one year after application.
