LIST OF TABLES

No.of Table	Particulars	Page
1	The weekly average temperature, soil temperature and relative humidity in Menoufia Governorate during 2016/2017 and 2017/2018 winter seasons.	31
2	Soil physical and chemical characteristics of the excremental site.	32
3	Effect of some nanobiostimulators in vegetative growth of tomato plants grown under low temperature condition (season1)	45
4	Effect of some nanobiostimulators in vegetative growth of tomato plants grown under low temperature condition (season2)	46
5	Effect of some nanobiostimulators in vegetative growth of tomato plants grown under low temperature condition (season1)	51
6	Effect of some nanobiostimulators in vegetative growth of tomato plants grown under low temperature condition (season2)	52
7	Effect of some nanobiostimulators in some growth analyses parameters of tomato plants grown under low temperature condition (season1)	54
8	Effect of some nanobiostimulators in some growth analyses parameters of tomato plants grown under low temperature condition (season2)	55
9	Effect of some nanobiostimulators on chilling injury (CI) percentage of tomato plants grown under low temperature condition (season1: 2016/2017 and season2: 2017/2018).	59
10	Effect of some nanobiostimulators in membrane leakage (ML), chlorophyll a and chlorophyll b of tomato leaves grown under low temperature condition (season1)	62
11	Effect of some nanobiostimulators in membrane leakage (ML), chlorophyll a and chlorophyll b of tomato leaves grown under low temperature condition (season2)	63
12	Effect of some nanobiostimulators in poly phenol oxidase (PPO), peroxidase (PO) and catalase (CAT) enzymes activities of tomato leaves grown under low temperature condition (season1)	68
13	Effect of some nanobiostimulators in poly phenol oxidase (PPO), peroxidase (PO) and catalase (CAT) enzymes activities of tomato leaves grown under low temperature condition (season2)	69
14	Effect of some nanobiostimulators on proline, total sugars (TS) and total phenols (TPh) in tomato leaves (season 1).	72
15	Effect of some nanobiostimulators on proline, total sugars (TS) and total phenols (TPh) in tomato leaves (season 2).	73
16	Effect of some nanobiostimulators on (N, P and K) concentration and protein in tomato leaves under low temperature condition (season1)	81
17	Effect of some nanobiostimulators on (N, P and K) concentration and protein in tomato leaves under low temperature condition (season2)	82
18	Effect of some nanobiostimulators in number of flowers, number of fruits and fruit set on tomato plants grown under low temperature condition (season1)	85
19	Effect of some nanobiostimulators in number of flowers, number of fruits and fruit set on tomato plants grown under low temperature condition (season2)	86
20	Effect of some nanobiostimulators in tomato yield and its components grown under low temperature condition (season1)	87
21	Effect of some nanobiostimulators in tomato yield and its components grown under low temperature condition (season2)	88

9	Effect of some nanobiostimulators on proline, total sugars (TS) and total phenols (TP) in tomato leaves (season1)	74
10	Effect of some nanobiostimulators on proline, total sugars (TS) and total phenols (TP) in tomato leaves (season2)	74
11	Effect of some nanobiostimulators on (N, P and K) concentration and protein in tomato leaves under low temperature condition (season1)	83
12	Effect of some nanobiostimulators on (N, P and K) concentration and protein in tomato leaves under low temperature condition (season2)	83
13	Effect of some nanobiostimulators in total number of flowers, total number of fruits, fruit set, yield and its components on tomato plants grown under low temperature condition (season1)	89
14	Effect of some nanobiostimulators in total number of flowers, total number of fruits, fruit set, yield and its components on tomato plants grown under low temperature condition (season2)	90

The response of antioxidant enzymes to exogenously applied to previous nanobiostimulators was different. It depended on the level of its concentration.

Chlorophyll content, free proline content and antioxidant enzymes (peroxidase, poly phenol oxidase and catalase), total sugars and phenols were all greater in chilled plants with NB₂ treatment compared to the control (chilled plants) and other treatments. The results indicated that the application of NB₂ (contains CPPU, BR, proline) can ameliorate the harmful effects of chilling stress and enhanced chilling resistance.

Chilling injury (CI) decreased sharply at all-time were taken (60, 75 and 90 DAT). Meanwhile, the lowest chilling injury recorded by treating tomato plants by NB₂, NB₁ and Si_{1,2} compared to untreated plants in both seasons. This results might be due to the effect of seaweeds, salicylic acid, proline, CPPU, BR and Si which significantly effective in increase growth parameters compared to chilled plants.

There was a significant reduction in leaf chlorophyll content due to chilling stress. Proline is one of the most common compatible osmolytes in abiotic stressed plants. Proline accumulations increased by NB₂ and NB₁ (contained proline) treated plants under chilling stress was found to be at maximum. Proline accumulation is the first response of plants exposed to chilling stress in order to reduce the injury effects to cells and stabilization of cell membrane and reduced membrane leakage.

Brassinolide, CPPU and proline presented in NB₂ sharply increased the antioxidant enzyme activity indicating efficient scavenging ROS. Antioxidant enzymes showed maximum response to NB₂, NB₁ and Si compared chilled plants only.

BR feeding reduced the formation of ROS triggered by chilling stress induced oxidative stress. The capacity of BR to ameliorate the desiccation stress and also BR could considerably alleviate the negative effect of chilling stress on tomato.

Chilling stress caused a significant reduction in tomato early yield and total yield with bad quality. NB₂, NB₁ and Si applications were more effective in improving tomato yield and its quality under chilling stress condition. The explanation of yield increasing of stressed plants after spraying with proline (present NB₁ and NB₂) proposed to the increased net photosynthetic, decreased rate of photorespiration, induced water use efficiency which reflect good growth rate as well as best yield with good quality.

In conclusion, results may show that tomato plants subjected to chilling created oxidative stress. NB₂, NB₁, Si as nanobiostimulators contain BR, CPPU, Seaweed and SA, which exerted the most protecting effect at low concentrations. Meanwhile, alleviation of chilling injury was more obvious with low concentration were the most promising dose. Which reflect a good performance of tomato plants under chilling with high quality and good quantity of yield.
