### ABSTRACT

The most serious problems of the environment are heavy metals toxicity throughout the industrial activities even in traces that harms for ecological system. Initially total of 30 isolates were screened on nutrient agar medium containing heavy metals: zinc, iron, cobalt, cadmium, copper and lead at four different concentrations (25, 50, 75 and 100 µg/mL in their salt form). Three isolates of *Bacillus* sp. were isolated from effluent industrial wastewater of Abu Kerqas Sugar Factory (27°55'28.8"N 30°49'00.4"E), identified by using 16S rRNA gene, and documented in GenBank as *Bacillus* spp. SMMAA-1 (LC472522), *Bacillus cereus* SMMAA-3 (LC472523), *Bacillus altitudinis* SMMAA-4 (LC472524).

The bacterial isolates which were selected based on their growth curve; IAA reaction and antibiosis effect were identified based on their morphological, biochemical characterization and utilization of carbohydrates as carbon sources. These isolates were evaluated for their abilities to bio-remediate the toxic heavy metals.

The experimental results showed that bacteria present resistance of six heavy metals. *B.cereus* is significantly effective for removal efficiency percentage of six heavy metals ( $Zn^{+2}$ ,  $Fe^{+2}$ ,  $Co^{+2}$ ,  $Cd^{+2}$ ,  $Cu^{+2}$  &  $Pb^{+2}$ ) (94.77%) from Industrial Wastewater than *Bacillus* spp. (83.19%) and *B.altitudinis* (83.21%). The higher removal efficiencies by bacterial isolates were found with  $Co^{+2}$ ,  $Cd^{+2}$  &  $Cu^{+2}$  and the lowest removal biosorption were recorded with  $Fe^{+2}$  ion.

Our results demonstrated that the importance for the dilution process for bioremediation to fast bio absorption or detoxifying of the heavy metals from the wastewater polluted to obtain the good results. The highest removal efficiency % was recorded with  $Zn^{+2}$  (72.26%) even though, the removal efficiency % of  $Cu^{+2}$  and  $Pb^{+2}$  were below (37.09% & 48.47%). The effective treatment was founded when SIWW was diluted by tap water 50% and treated with *Azolla filiculoides* as fresh.

In case of *azolla filiculoides* as dry we noted that the highest removal efficiency % was observed by the diluted treatment (SIWW50% + tap water 50% + Ad) with  $Zn^{+2}$  ion (82.97%) while the lowest removal % was recorded by the 100% SIWW + Ad with  $Cu^{+2}$  ion (49%).

When used the combined of *Azolla filiculoides* fronds as fresh (Af) with the isolated bacteria (*Bacillus* spp., *B. cereus* & *B. altitudinis*) the results were obtained that the maximum removal % of heavy metals were observed as followed ( $Zn^{+2}$  >  $Co^{+2}$  >  $Cd^{+2}$  >  $Pb^{+2}$  >  $Cu^{+2}$  >  $Fe^{+2}$ ) and the values of its metals were (99.68% > 99.61

## Abstract and Key words

---

% > 99.30 % > 99.11 % > 97.67% > 95.38 %) respectively. The best combined treatments for removal % of heavy metals was founded with the combined treatment (Af + *Bacillus* spp.) with  $\text{Co}^{+2}$  ion (99.91%). The lowest removal % was observed with the treatments (Af+ *Bacillus* spp.) and (Af + *B. cereus*) with  $\text{Fe}^{+2}$  (95.19%).

Also, when used the combined of *Azolla filiculoides* fronds as dry (Ad) with the isolated bacteria (*Bacillus* spp., *B. cereus* & *B. altitudinis*) the results were obtained that the removal % of heavy metals arranged from the high to low (from 99.88% for  $\text{Co}^{+2}$  to 94.40% for  $\text{Fe}^{+2}$ ) as followed  $\text{Co}^{+2} > \text{Cd}^{+2} > \text{Zn}^{+2} > \text{Pb}^{+2} > \text{Cu}^{+2} > \text{Fe}^{+2}$ . The all combined treatments of *Bacillus* spp., *B. cereus* and *B. altitudinis* + Ad with  $\text{Co}^{+2}$  showed highly removal % (99.92 %, 99.86% and 99.86%) respectively. The lowest removal % by the above mentioned combined treatments mean were recorded with  $\text{Fe}^{+2}$  (94.40%).

**Key words:** Bioremediation, Phytoremediation, Heavy metals, toxicity, Industrial Wastewater, Effluent, *Bacillus* spp., *Bacillus cereus*, *Bacillus altitudinis*, *Azolla filiculoides*.
