Vice Dean of Graduate Studies

Name of candidate: Shimaa Mohammed Aly Mohammed Elian

Degree:PhD.

Title of Thesis: Biochemical and molecular studies on some species of mullet fish

Supervisors: Prof .Dr. Mohammed Hassanein Soliman

Dr. Basita Abbas Hussein

Prof. Dr. Mohammed Elsayd Farag

Department: Genetics

Approval : 14 / 7/2021

ABSTRAC

Fish is one of the most important foods of the human because of its high nutritional content especially polyunsaturated fatty acids (PUFAs omega-3 and omega-6) which are available in mullet species. The aims of this study was to show how the traditional, biochemical and molecular methods can be used to assess the genetic diversity among the four mullet species, namely *Mugil cephalus*, *Liza ramada*, *Valamugil sibilil* and *Liza garana* ,in addition to bioinformatics tools .The fish were collected from four different governorates in Egypt (Alexandria, Ismailia, Port Said and Damietta). The four species were morphologically characterized using seventeen morphometric characters. The ANOVA test showed that out of seventeen characters four morphometric characters (i.e., head length, distance of first dorsal fin, distance of second dorsal fin and body weight) showed significant differences ($p<0.05$) among the four species. While, the remaining morphometric characters revealed no significant differences ($p>0.05$) among the species. The morphology-based dendrogram divided the four species into two main clusters. The first cluster was divided into two subclusters and comprised the ten genotypes. The second cluster contained the six remaining genotypes and was divided into two subclusters. Protein banding patterns using SDS-PAGE (protein electrophoresis) revealed the total number as 59 bands in the profiles of the four species. *Liza garana* (Port Said) showed the highest number of bands (18). While, the lowest number of protein bands showed in *Valamugil sehili* (Ismailia) was 10 bands. The dendrogram constructed using protein data was successful in clustering the species together. Moreover, eleven SCoT primers and ten ISSR primers were used to estimate the genetic diversity among the four mullet species. The two markers SCoT and ISSR successfully amplified amplicons with a total number of 176 and 132 of which 153 and 111 were polymorphic, representing a percentage of polymorphism of 86.9% and 84.1% polymorphic amplicons/ primer, respectively. The similarity indices ranged from 0.47 to 0.84, 0.54 to 0.92 and 0.52 to 0.86 for SCoT, ISSR and combined, respectively. Cluster analysis based on similarity matrices of SCoT, ISSR and combined dendrograms revealed some similarities;i.e. the *Mugile cephalus* (Alexandria, Ismailia and Port Said) clustered together and the *Valamugil sehili* (Ismailia and Damietta) clustered together based on the three dendrograms. Also, *Liza ramada*,*Liza garana* (Damietta) and *Mugile cephalus* (Damietta) were clustered together based on the three dendrograms. Concerning the PCR product, one SCoT fragment was sequenced, blasted and aligned with the NCBI data based. This fragment revealed a high similarity to a sequence located on Chr1 near a gene called "Type II keratin E3 for fish species *Dicentrarchus labrax* (the European bass).

Key words: Mullet fish, morphological characterization, protein electrophoresis, molecular markers (SCoT and ISSR)

CONTENTS

INTRODUCTION	1
REVIEW OF LITERATURE	7
1-Morphological characterization of the fish species	7
2-Biochemical characterization of the fish species	19
3-Molecular characterization of the genetic diversity among fish species	28
4-DNA Sequencing analysis	43
MATERIALS AND METHODS	48
1-Materials	48
2-Methods	48
a- Morphological characterization	49
b - Biochemical characterization (SDS –PAGE analysis of protein)	50
c- Molecular characterization	54
1-Start Codon Targeted Sequence (SCoT) analysis	56
2. Inter Simple Sequence Repeats (ISSR)-PCR analysis	57
3-Data analysis	59
d- Sequencing analysis	60
RESULTS AND DISCUSSION	62
The genetic diversity among the four mullet species	62
a-Morphological characterization	62
b. Biochemical Characterization	73
c. Molecular characterization among the four mullet species	82
1- Start Codon Targeted (SCoT) analysis of the mullet species	82

2-Inter simple sequence repeated (ISSR) analysis of the four mullet species	89
3- Combined genetic relationships and cluster analysis as revealed by the combined of SCoT and ISSR markers	95
4- Sequence analysis using Bioinformatics tools	98
CONCLUSION	101
